

ABSTRACT

A display apparatus of the present invention has been made so that: in cases where a video signal cannot be normally received, the display apparatus allows a display by which one can recognize whether or not a jamming electric wave in an operation frequency band used for wireless communication makes it impossible to normally receive a video signal. That is, the display apparatus of the present invention is a display apparatus (B) for receiving at least a video signal by wireless communication, the display apparatus (B), including: wireless receiving means (9) for receiving the video signal that is wirelessly transmitted; jamming signal detecting means (15) for detecting, in an operating frequency band used for the wireless communication, a jamming signal other than the video signal; and jamming signal information outputting means (15) for, in response to the detection of the jamming signal, outputting jamming signal information indicating presence of the jamming signal.
